"""
THE SYNDICATE: GLOBAL COMPENSATION MATRIX & EQUILIBRIUM ENGINE (ACT OF 2026)
================================================================================
Open-Source Reference Implementation of the Calibrated Thermodynamic,
Full-Lifecycle (LCA), and Temporal Irreversibility Accounting Standard.

Core Philosophy:
    "Our goal is not to coerce, punish, or subjugate, but to prove—through
    rigorous mathematics and indisputable physics—that mindful consumption
    and the rational stewardship of resources are the only reliable keys
    to human prosperity."

Mathematical Core:
    1. Extended Dynamic Equilibrium Formula (I_ndp Index):
       Tariff ($) = B_r * [ Sum(M * D_f * E_v * L_c) * T_ir ] * M_f

    2. Universal Planetary Impact Equation (UPIE-2026 Batch/Capacity Mode):
       Phi ($) = B_r * [ (S_infra * E_d * L_c_infra) +
                         Sum(Q_i * m_i * D_f_i * E_v * L_c * T_ir) ] * M_f

    3. Temporal Irreversibility & Recovery Deficit Coefficient (T_ir):
       T_ir = 1.0 + I_geo + C_bio + ln(1 + tau_recovery / tau_emission)

LEGAL SAFE HARBOR, METHODOLOGICAL DISCLAIMER & OFFICIAL CITATIONS

1. Scientific Modeling & Fair Comment Notice (Safe Harbor Statement)

This Manifesto, the Universal Planetary Impact Equation (\text{UPIE-2026}), the I_{ndp} Dynamic Equilibrium Formula, and the accompanying Python 3 software engine constitute an open-source theoretical research framework, econometric modeling exercise, and philosophical work of public interest.

No Factual Assertion of Unlawful Conduct: All monetary figures termed "liabilities," "tariffs," "debts," or "physical bankruptcy" within this publication represent theoretical thermodynamic and full-lifecycle externality valuations derived from mathematical modeling. They do not represent financial liabilities under Generally Accepted Accounting Principles (GAAP/IFRS), nor do they allege that any named corporate entity has violated existing municipal, state, or federal environmental statutes beyond already adjudicated public settlements.

Evaluative Indices & Protected Opinion: Coefficients such as the Systemic Utility, Obsolescence & Hypocrisy Multiplier (M_f) and the Temporal Irreversibility Coefficient (T_{ir}) are normative, evaluative indices reflecting the authors' scientific and ethical value judgments regarding resource longevity (e.g., 2-to-5-year replacement cycles versus 25-to-50-year modular engineering). Under international human rights conventions (Article 19 of the ICCPR), European Court of Human Rights jurisprudence, and the First Amendment of the United States Constitution, mathematical modeling and value judgments on matters of global ecological concern are fully protected expressions of scientific opinion and fair comment.

Synthetic Code Simulations: Any sample data structures within the Python source code (including CitizenRegistryCard demonstrations, cryptographic hash placeholders, and simulated sensor node counts) are synthetic software test vectors designed solely to illustrate algorithmic functionality for open-source developers.

Open Right of Reply & Algorithmic Recalibration (Absence of Malice): This framework operates in strict scientific good faith. Any enterprise referenced as an industry benchmark in Section III is formally invited to submit audited, primary mass-balance documentation (verified raw material and chemical reagent procurement versus shipped product mass and closed-loop recycling) via the repository issue tracker. Upon cryptographic verification of cleaner operational metrics, the Python reference engine will automatically recalibrate and publish the updated lower footprint.

2. Primary Peer-Reviewed & Official Regulatory Sources for Section III Dossiers

All physical baseline parameters modeled in the 9 Sector Dossiers are anchored in publicly available scientific literature, government regulatory filings, and judicial records:

Dossier 1 (Maritime HFO Emissions & Shipbuilding LCA): International Maritime Organization (IMO) Fourth Greenhouse Gas Study; peer-reviewed Life Cycle Assessments of coking-coal blast furnace steelmaking and heavy bunker fuel (\text{SO}_x, \text{NO}_x, vanadium/nickel particulate) marine dispersion.

Dossier 2 (Tesla Inc. Benchmark): Environmental compliance baseline references the official judicial settlement entered in February 2024 between Tesla, Inc. and 25 California County District Attorneys (People of the State of California v. Tesla, Inc., Alameda County Superior

Court, Case No. 24CV060382) regarding hazardous waste labeling and disposal; upstream lithium brine and nickel/cobalt extraction metrics derived from IEA and peer-reviewed EV battery LCA studies.
Dossier 3 (Apple Inc. Benchmark): Semiconductor fabrication power, ultrapure water, and perfluorinated chemical (PFAS) etching baselines derived from TSMC/industry sustainability disclosures and peer-reviewed microelectronics LCA literature (Boyd et al.; Kuo et al.); hardware serialization and repairability assessments reference official investigations by the French Directorate General for Competition, Consumer Affairs and Fraud Control (DGCCRF) and European Union Right-to-Repair legislative impact reports.
Dossier 4 (SpaceX Launch Fleet Benchmark): Stratospheric black carbon soot, water vapor, and thermal \text{NO}_x ozone-depletion potentials derived from peer-reviewed atmospheric modeling (Ross & Sheaffer, Earth's Future; Ryan et al., 2022, AGU); Starbase industrial water discharge references official 2024 U.S. Environmental Protection Agency (EPA) and Texas Commission on Environmental Quality (TCEQ) administrative enforcement notices.
Dossier 5 (Starlink Megaconstellation Benchmark): Upper-atmosphere vaporization of expired satellites into conductive aluminum oxide (\text{Al}_2\text{O}_3) nanoparticles and metallic ash is anchored in peer-reviewed geophysical research by the U.S. National Oceanic and Atmospheric Administration (NOAA) (Murphy et al., 2023, PNAS: "Metals from spacecraft reentry in stratospheric aerosol particles") and the University of Southern California (Ferreira et al., 2024, Geophysical Research Letters: "Potential Ozone Depletion From Satellite Demise During Atmospheric Reentry"). Geopolitical connectivity restrictions in active conflict zones reference documented historical records in Elon Musk by Walter Isaacson (Simon & Schuster, 2023, pp. 529–533) and U.S. Senate Armed Services Committee records.
Dossier 6 (Hyperscale Data Centers): Power and adiabatic water consumption baselines derived from Lawrence Berkeley National Laboratory (LBNL) United States Data Center Energy Usage Reports and academic AI water-footprint audits (Li et al., 2023).
Dossier 7 & 8 (Chemical Industry & Fast-Fashion Benchmarks): Derived from U.S. EPA Toxics Release Inventory (TRI) chemical manufacturing baselines, Ellen MacArthur Foundation textile circularity reports, and UN Environment Programme (UNEP) petrochemical microfiber studies.
Dossier 9 (ExxonMobil Corp. Benchmark): Historical internal climate modeling accuracy (1977–1982) versus public communications is anchored in the peer-reviewed Harvard University study published in Science (Supran, Rahmstorf, & Oreskes, 2023: "Assessing ExxonMobil's global warming projections"); hydraulic fracturing aquifer impact and fugitive methane (80\text{x} 20-year GWP) baselines reference IPCC Sixth Assessment Report (AR6) and U.S. EPA Permian Basin satellite methane surveys.
